Set working time slot	

Session Mode

The session mode is a screen that stops the notifications of the phone when the user does his task. The task and description are visible with the time the user still has to work. A button suggests taking a break. If the task is not done, the user can replay it.

We did put the possibility to have a session mode when we create a task but we didn't do the real session mode. We preferred to focus on more important features for this first version of the app.

Advertissement

To earn money from the app, we decided to use advertisements that appear at some key moments. The premium version allows the user to delete the advertisement.

We didn't see the use of presenting a prototype with advertisements.

* This is the plan for the first prototype that has been delayed.
